

Easily and graphically identify, organize and communicate changes in model data with KeyCreator Compare.

Design changes can happen at nearly any moment in the design-to-manufacture process. How clearly and accurately these changes are communicated, if they are communicated at all, can make or break both product quality and profit margins. The key to success is a consistent, well-defined method for detecting and reporting all design changes.

KeyCreator Compare is an easy to use toolset specifically designed to quickly and accurately identify any revisions between two file sets of components or assemblies. Job shops and contract manufacturers can import a new revision from an OEM, compare the versions, make updates in real time and then re-compare to make sure all of the revisions were made exactly as specified.

KeyCreator Compare will save many hours from manually checking for design changes and will eliminate the possibility of missing revision changes before going to production. The result is a streamlined, electronic process to reliably reduce risks and increase profitability.

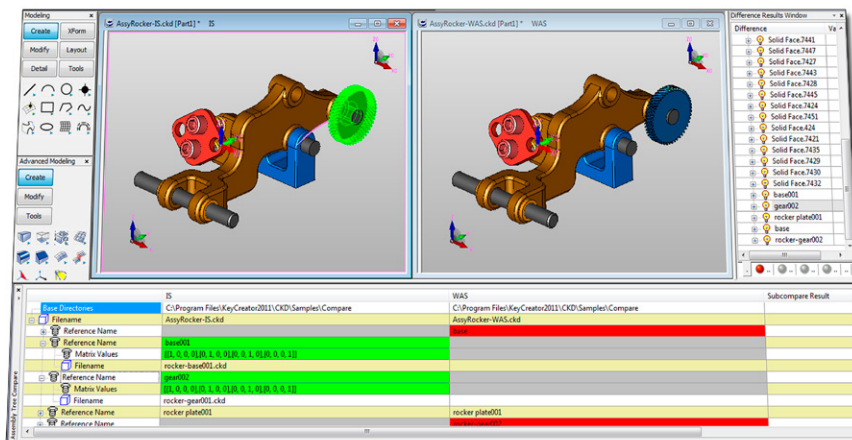

Quickly overlay models to see differences using the Examine Window.

User customizable comparison criteria.

Use KeyCreator Compare for:

- Is/Was comparisons for quoting manufacturing jobs and changes
- Collaboration on design changes via live or virtual meetings
- Revision management for design updates
- Customer confirmation of changes including detailed mark-ups using simple screen grabs

Interactive visual 3D walk-through of results from single parts to assemblies.
